

How to Create a Scheduled Task to Automatically Rotate the Centrifly Auditing Database

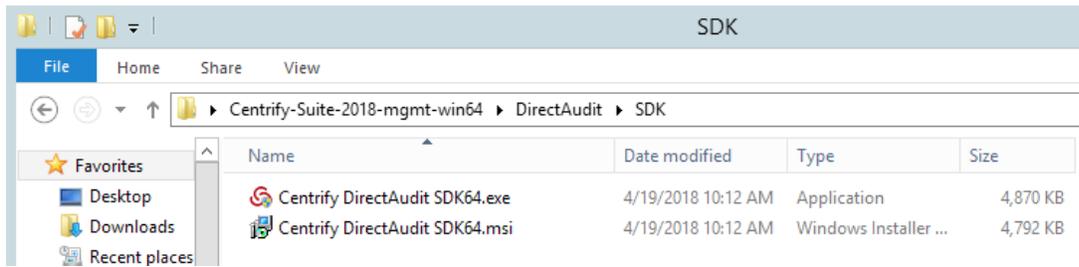

This document describes how to create a scheduled task that will automatically rotate the Centrifly Auditing audit store database on the first day of each month. You can easily modify the command described below to suit your requirements.

Please refer to the following MSDN article for a complete list of Task Scheduler (Schtasks.exe) commands.

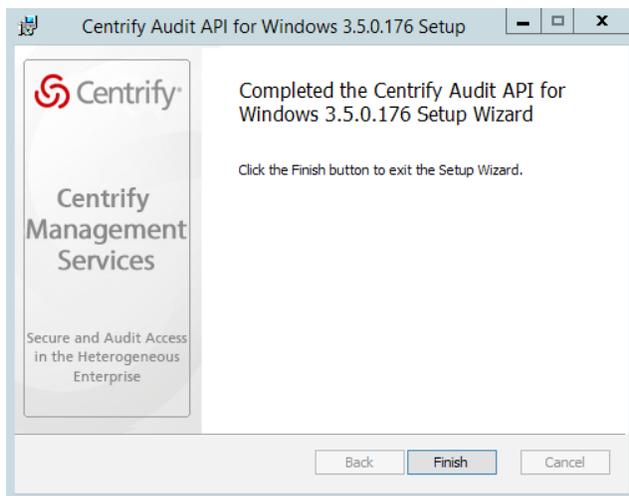

[https://msdn.microsoft.com/en-us/library/windows/desktop/bb736357\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/bb736357(v=vs.85).aspx)

Installing the Centrifly DirectAudit SDK

The DirectAudit SDK installer is included with the Centrifly Suite download, within the `..\DirectAudit\SDK` directory. It is available in both `.exe` and `.msi` installer types.

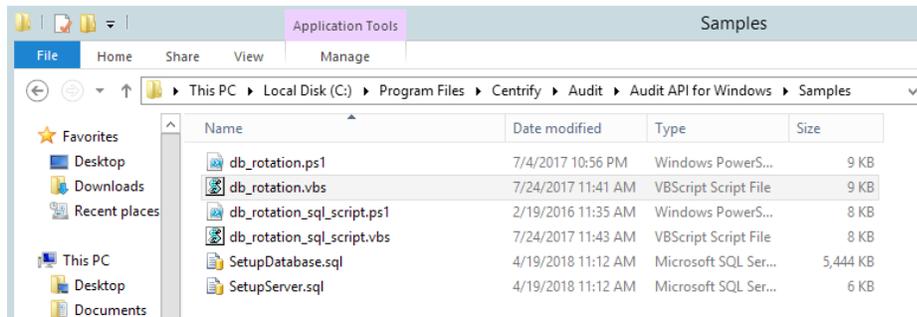

Run the **Centrifly DirectAudit SDK64.exe** installer file, agree to the EULA, and next → finish through the installation.

The Auditing SDK includes four sample scripts that can be modified to suit your requirements. For our purposes, we will focus on the **db_rotation.vbs** script. For more information on all of the sample scripts, please refer to the [Database Management Guide](#).

The sample scripts are located in **C:\Program Files\Centrify\Audit\Audit API for Windows\Samples**.

Creating the Scheduled Task

Open a PowerShell command prompt as Administrator, and change the directory to the location of the sample scripts.

```
cd 'C:\Program Files\Centrify\Audit\Audit API for Windows\Samples'
```

Next, we run a command that will add the **db_rotation.vbs** script as a scheduled task called **'rotate_database'**. It's a long command, but I will break it down so that you can easily modify it match your environment.

Here is an example of what the command should look like:

```
schtasks.exe /Create /TN "rotate_database" /TR "cscript.exe 'C:\Program Files\Centrify\Audit\Audit API for Windows\Samples\db_rotation.vbs' DefaultInstallation Demo-Network@centrify.vms-AuditStore member.centrify.vms\CENTRIFY_SUITE AuditStore" /RU domain\dbadmin /RP P4ssw0rd$ /RL Highest /SC Monthly /MO 1
```

The command contains the following components:

```
schtasks.exe /Create /TN <task_name> /TR <task_Command> /RU <run_as_user> /RP <run_as_user_password> /RL <run_level> /SC <recurrence_rate> /MO <recurrence_increment>
```

Where

- **task_name:** rotate_database
- **task_command:** cscript.exe 'C:\Program Files\Centrify\Audit\Audit API for Windows\Samples\db_rotation.vbs' DefaultInstallation Demo-Network@centrify.vms-AuditStore member.centrify.vms\CENTRIFY_SUITE AuditStore"
- **run_as_user:** centrify\dbadmin
Note: I used a domain user (domain\user) for the run as user, but 'NT AUTHORITY\SYSTEM', or just 'SYSTEM' are also valid values.
- **run_as_user_password:** P4ssw0rd\$

Note: You must supply a password to enable the task to run even if the run as user is not logged in. If you choose to use 'NT AUTHORITY\SYSTEM' or 'SYSTEM', there is no password.

- **run_level:** Highest
- **recurrence_rate:** Monthly
- **recurrence_increment:** 1

The task command consists of the following elements:

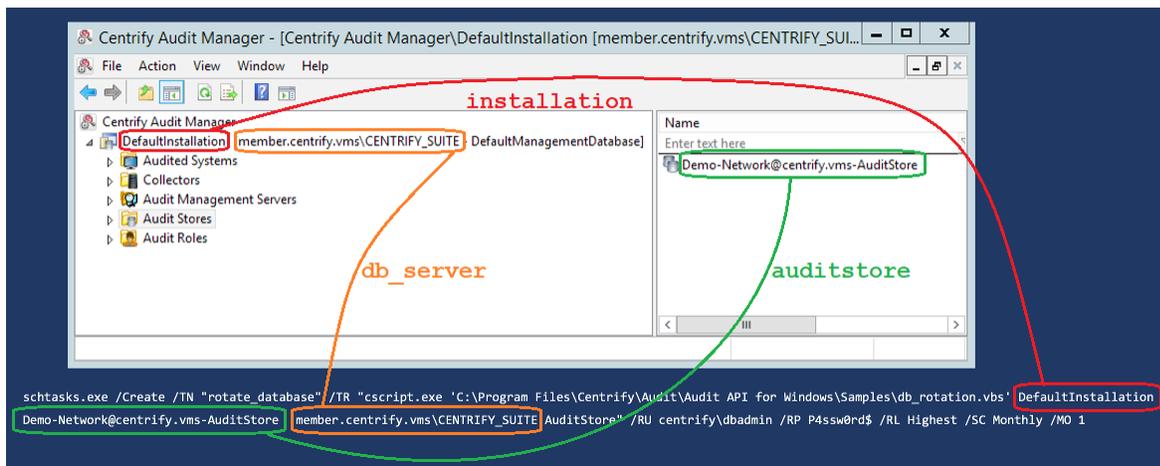

```
<parser> '<install_path>\<vbs_script>' <installation> <auditstore>  
<db_server> <db_prefix>
```

Where

- **parser:** cscript.exe
- **install_path:** C:\Program Files\Centrify\Audit\Audit API for Windows\Samples
- **vbs_script:** db_rotation.vbs
- **installation:** DefaultInstallation
- **auditstore:** Demo-Network@centrify.vms-AuditStore
- **db_server:** member.centrify.vms\CENTRIFY_SUITE
- **db_prefix:** AuditStore

Note: The *db_prefix* value can be whatever you want to name the audit database. A date stamp will be attached to the *db_prefix* to compose the new database name.

You can easily determine the *installation*, *auditstore*, and *db_server* values by viewing the **Centrify Audit Manager** console. See below.

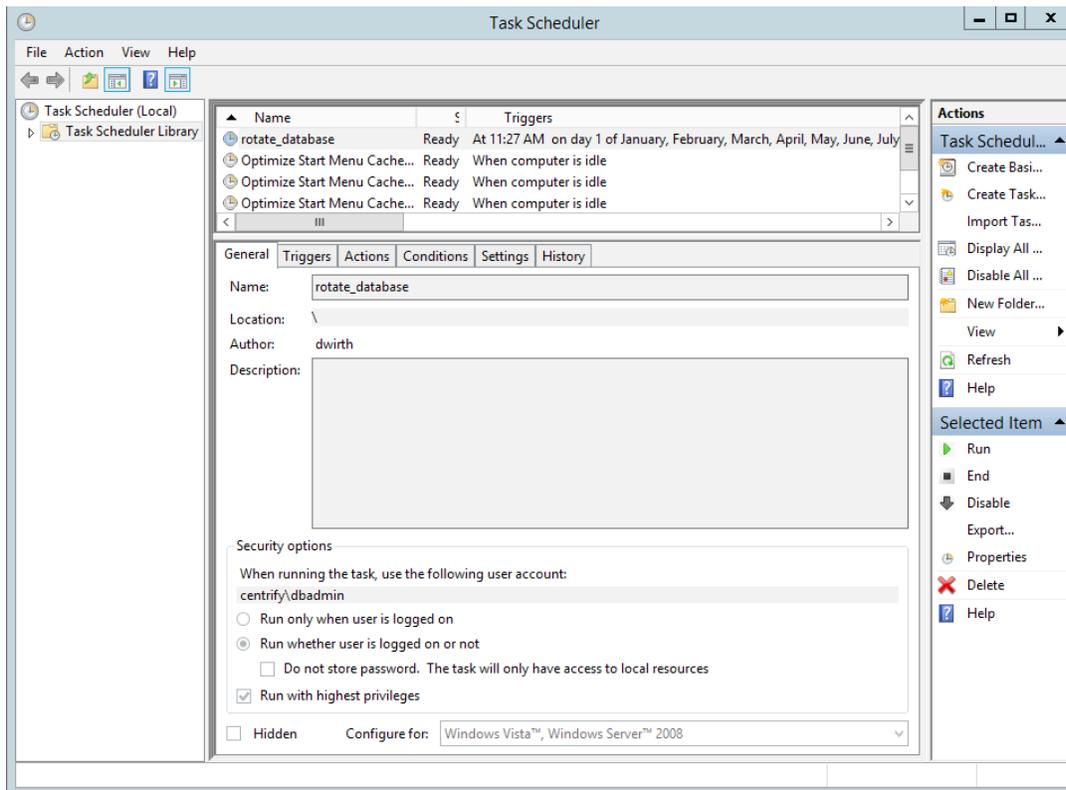

After running the command, you should receive a SUCCESS message.

```

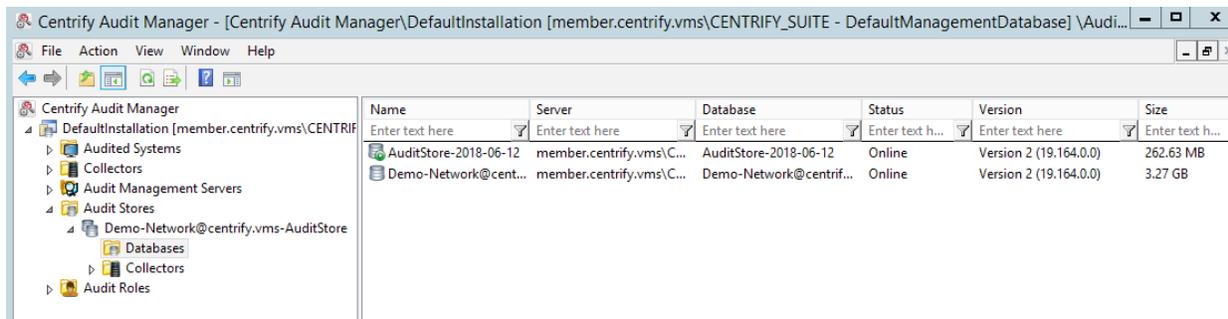

Administrator: Windows PowerShell
PS C:\Program Files\Centrify\Audit\Audit API for Windows\Samples> schtasks.exe /Create /TN "rotate_database" /TR "cscript.exe C:\Program Files\Centrify\Audit\Audit API for Windows\Samples\db_rotation.vbs" /DefaultInstallation Demo-Network@centrify.vms-AuditStore member.centrify.vms\CENTRIFY_SUITE AuditStore" /RU centrify\dbadmin /RP P4ssw0rd$ /RL Highest /SC Monthly /MO 1
SUCCESS: The scheduled task "rotate_database" has successfully been created.
PS C:\Program Files\Centrify\Audit\Audit API for Windows\Samples>

```

You should now be able to view the newly created task in **Task Scheduler**.

After the task runs, the newly created database is marked as active. The database that has been rotated out will remain attached. By default, the script is configured to detach rotated databases that are older than two years.

If you right-click on the rotated database within the **Centrify Audit Manager**, you can choose to detach or delete it.
